

MOST INNOVATIVE ENGINEERING BUSINESS

joylab

An innovative start-up, joylab specialises in technical product engineering such as robotics, sensor technology and medical technology. Unlike traditional engineering offices, joylab invents and develops products using inspiration from new technology and trends in development, while rapid in-house prototyping allows quick implementation of solutions. The company also sells its own invention, NECTAR, which is a theft-proof mobile charging power bank designed to give restaurants, hotels and other businesses the ability to offer customers a convenient charging service, complete with branding as required.

The judges were impressed by joylab's inspiring and inventive approach to the market, which services forward-thinking companies in need of state-of-the-art engineering support. The small team offers a flexible approach along with a responsive and rapid turnaround, which saves valuable time and costs. Various financing models are available to clients, including traditional remuneration and royalties or investments, allowing clients to implement ideas with low initial costs. Meanwhile, NECTAR solves an everyday problem for modern consumer-facing businesses, giving them an edge above competitors. The entrepreneurs at joylab bring enthusiasm to their trade, hence the company name, and a passion for technology that drives success.
